4 Duty Cycle, Tx-Sequency, Tx-gap

4.1 Test Standard and Limit

4.1.1 Test Standard

ETSI EN 300 328 V2.2.2 clause 4.3.1.2

4.1.2 Test Limit

Test Item	Limit
FHSS equipment	The maximum Tx-sequence time shall be 5 ms while the minimum Tx-gap time shall be 5 ms. For non-adaptive FHSS equipment: Duty Cycle shall be equal to or less than the maximum value declared by the supplier.

The frequency range of the equipment is determined by the lowest and highest frequencies occupied by the spectrum envelope.
fH is the highest frequency of the spectrum envelope: it is the frequency furthest above the frequency of maximum power where the e.i.r.p. spectral density drops below the level of -80 dBm/Hz (-30 dBm if measured in a 100 kHz bandwidth).
fL is the lowest frequency of the spectrum envelope; it is the frequency furthest below the frequency of maximum power where the e.i.r.p. spectral density drops below the level of -80 dBm/Hz (or -30 dBm if measured in a 100 kHz bandwidth).
For a given operating frequency, the width of the spectrum envelope is (fH - fL). In equipment that allows adjustment or selection of different operating frequencies, the power envelope takes up different positions in the allocated band. The frequency range is determined by the lowest value of fL and the highest value of fH resulting from the adjustment of the equipment to the lowest and highest operating frequencies.

4.2 Test Setup

These requirements do not apply for equipment with a maximum declared RF Output power of less than 10 dBm e.i.r.p or for equipment when operating in a mode where the RF Output power is less than 10 dBm e.i.r.p.

Note:
The Equipment e.i.r.p. power is less than 10 dBm, so no requirement for this test item.

5 Dwell Time, Minimum Frequency Occupation and Hopping Sequence

5.1 Test Standard and Limit

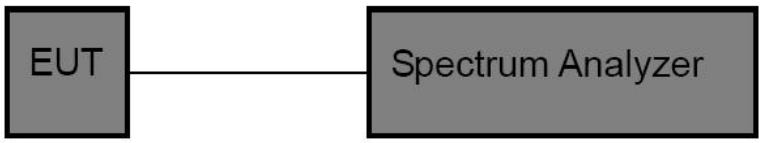
5.1.1 Test Standard

ETSI EN 300 328 V2.2.2 clause 4.3.1.3

5.1.2 Limits

Test Item	Frequency Range (MHz)	Limit	Result
Dwell Time	2400-2483.5	0.4s	PASS
Minimum Frequency Occupation Time		Not exceeding four times of the dwell time per hop and the number of hopping frequencies in use	PASS
Hopping Sequence		At least 15 hopping frequencies at all times	PASS

5.2 Test Setup



5.3 Test Procedure

1. The transmitter output was connected to the spectrum analyzer.
2. Set Resolution Bandwidth of the spectr
um analyzer to 1MHz and Video Bandwidth to
1MHz.
3. Use a video trigger with the trigger leve
l set to enable triggering only on full pulses.
4. Sweep Time is more than once pulse time.
5. Set the center frequency on any frequency would be measured and set the frequency span to zero span.
6. Measure the maximum time duration of one single pulse.
7. Set the EUT for DH5, DH3 and DH1 packet transmitting.
8. Measure the maximum time duration of one single pulse.

9. DH5 Packet permit maximum 1600/79/6=3.37 hops per second in each channel (5 time slots RX, 1 time slot TX). So, the dwell time is the time duration of the pulse times 3.37 *

31.6=106.6 with 31.6 seconds.
DH3 Packet permit maximum 1600/79/4=5.06 hops per second in each channel (3 time slots RX, 1 time slot TX). So, the dwell time is the time duration of the pulse times 5.06 * 31.6=160 with 31.6 seconds.
DH1= Packet permit maximum 1600/79/2=10.12 hops per second in each channel (1 time slot RX, 1time slot TX).So, the dwell time is
the time duration of the pulse times 10.12 * 31.6=320 within 31.6 seconds.
10. The lowest, middle and highest frequency of the EUT should be tested.

(1) Change the centre frequency of the analyzer to 2484MHz + BW and perform the measurement for the first 1MHz segment within range 2483.5MHz +BW to 2483.5 MHz +2BW. Increase the centre frequency in 1MHz
steps and repeat the measurements to cover this whole range. The centre frequency of the last 1 MHz segment shall be set to 2483.5 MHz+ 2BW-0.5 MHz.

Step 4 (2400 MHz-BW to 2400 MHz):

(1) Change the centre frequency of the analyzer to 2399.5MHz and perform the measurement
for the first 1MHz segment within range 2400 MHz -BW to 2400 MHz Reduce the centre frequency in 1MHz steps and repeat the measurement to cover this whole range. The centre frequency of the last 1 MHz segment shall be set to 2400 MHz -BW+ 0.5 MHz.

Step 5 (2400 MHz-BW to 2400 MHz):

(1) Change the centre frequency of the analyzer to 2399.5MHz-BW and perform the measurement for the first 1MHz segment within range 2400 MHz -2BW to 2400 MHz ¨CBW. Reduce the centre frequency in 1MHz steps and repeat the measurement to cover this whole range. The centre frequency of the last 1 MHz segment shall be set to 2400 MHz -2BW+ 0.5 MHz.

13 Receiver Blocking

13.1 Test Standard and Limit

13.1.1 Test Standard

ETSI EN 300 328 V2.2.2 clause 4.3.1.11

13.1.2 Test Description

Receiver blocking is a measure of the capability of the adaptivity mechanism to operate as intended (see clause 4.3.1.6) in the presence of an unwanted signal (blocking signal) on frequencies other than those of the operating channel and the adjacent channels.

Adaptive Frequency Hopping equipment is allowed to have Short Control Signaling Transmissions (e.g. ACK/NACK signals, etc.) without sensing the frequency for the presence of other signals. Please see clause 4.3.1.6.3 Short Control Signaling Transmissions

13.1.3 Test Lmits

Adaptive Frequency Hopping equipment shall comply with the requirements defined in clauses 4.3.1.6.1 (LBT based DAA) or 4.3.1.6.2 (non-LBT based AA) in the presence of a blocking signal with characteristics as provided in bellow:

d)

13.2 Test Setup

This requirement does not apply to non-adaptive equipment or adaptive equipment operating in a non-adaptive mode providing the equipment complies with the requirements and /or restrictions applicable to non-adaptive equipment.

In addition, this requirement does not apply for equipment with a maximum declared RF Output power level of less than 10 dBm e.i.r.p.for equipment when operating in a mode where the RF Output power is less than 10 dBm e.i.r.p.

Note:
The Equipment e.i.r.p. power is less than 10 dBm, so no requirement for this test item.
